Fictional Ääni — extended community pilot

Concept paper

AI-generated draft. Not a funding eligibility assessment. Verify requirements against the relevant funding programme.

Background

Fictional community arts groups across two neighboring regions report limited capacity to choose, test, and maintain basic digital tools. The idea is to build practical confidence through short peer-supported activities. Fictional community participants practise digital skills through accessible arts workshops. Peer mentors help volunteers choose a practical task and record a simple demonstration. The pilot uses synthetic examples, shared reflection and short follow-up sessions. Finnish character check: ä ö å Ä Ö Å. The fictional pilot works with groups that run small events and maintain shared community spaces. Participants have different starting points, so each workshop offers a guided task and an independent option. Materials use plain language and accessible examples. Peer mentors receive a short briefing before the sessions. Activities are tested in a safe practice environment using fictional event information. The groups record what helped them learn and identify practical barriers. Follow-up meetings focus on continuing one useful practice rather than adopting many new tools. Participation is voluntary, and no confidential partner or employer information is collected.

Objectives

O1

Improve participants' ability to select and use a digital tool for a routine organizational task.

O2

Help participating groups establish a realistic plan for continuing one new digital practice.

O3

Develop an accessible peer-support routine so fictional community groups can share learning and continue one useful digital practice after the pilot.

O4

Document a concise learning model that another fictional arts group can understand, adapt and test using its own voluntary participants and synthetic examples.

Target groups

Staff and volunteers at fictional community arts groups

Activities

A1 Linked objectives: O1

Run a short introductory workshop using fictional organizational scenarios.

A2 Linked objectives: O1, O2

Facilitate a peer lab where participants try selected tools and discuss accessibility.

A3 Linked objectives: O2

Support each group to outline a small follow-up practice and review date.

A4 Linked objectives: O1, O3

Prepare an accessible practice pack with fictional event information, step-by-step instructions and alternative task formats. Invite a small group of volunteers to review the language and note unclear instructions before the first workshop.

A5 Linked objectives: O2, O3

Organise peer-support meetings where volunteers demonstrate one completed task, describe a barrier and ask for practical suggestions. Record only anonymous observations about the learning process and make no judgments about personal ability.

A6 Linked objectives: O2, O4

Invite fictional groups to test their chosen practice during a simulated community event. Compare the process with the initial task and discuss which support arrangements could realistically continue with existing volunteer resources.

A7 Linked objectives: O3, O4

Produce a short learning guide based on the pilot observations. Review it with fictional peer mentors, document assumptions and remaining questions, and share the fictional demonstration materials for further local discussion.

Expected results

R1 Linked activities: A1, A2

Participants demonstrate one practical digital task in a workshop or peer-lab exercise.

R2 Linked activities: A3

Participating groups produce a brief plan to continue one selected digital practice.

R3 Linked activities: A4, A5, A6, A7

Fictional groups have an accessible peer-support checklist and a concise learning guide, supported by documented trial observations and a clear description of what still needs to be tested.

Indicators

I1 Linked results: R1

Number of participants who complete a practical digital task to an agreed checklist.

Measurement method

Count completed checklists at the end of the fictional workshop exercises.

I2 Linked results: R2

Number of participating groups with a written follow-up practice plan.

Measurement method

Count plans reviewed against a short completeness checklist.

I3 Linked results: R3

At least three fictional groups complete a guided demonstration and identify one support arrangement they are willing to trial again.

Measurement method

Use a short observation checklist during the simulated task and ask each group to describe its selected support arrangement. Compare the completed checklists with the stated demonstration criteria and record remaining uncertainties without collecting personal data.

Assumptions

Participating groups can set aside time for short learning activities.

Fictional groups can allocate a small amount of volunteer time to the pilot; this assumption must be checked before scheduling the activities.

Accessible materials and peer support reduce participation barriers, but additional adaptations may be needed after the first trial.

Open questions

Which digital tasks are most relevant to the participating groups?

What lightweight follow-up support would be practical?

What support can the fictional groups maintain after the workshops end?

How will the learning guide be reviewed before use with a new group?
